

Configuration Upgrade Path going from IEE to IFS Cloud Web

When moving from IFS Enterprise Explorer to IFS Cloud, the configuration functionalities will try to distinguish server-side configuration from the client-side layout configurations.

The IFS Cloud Web client is using projections to manipulate and read data. Therefore, before extending the client layout with configurations, you would need to extend the server(projection) parts with configurations. In some cases (like Custom Attributes) the projections will be automatically extended.

Changes done to the layout via the Page Designer are stored as configuration rather than profile information.

NOTE: Content in this Documentation might change regularly depending on the design descisions taken by RnD.

Concept Mapping Summary

IFS EE/Apps10	Available in IFS Cloud	IFS Cloud	Upgraded
Custom Fields	Yes	Custom Attributes + Page Configuration	- The attributes with definition and storage are upgraded - Layout needs to be redone - Assumes the pages in IFS Aurena are based on same data source as in IFS EE
Custom Logical Units	Yes	Custom Entities	Yes
Custom Page	Yes	Page Configurations	No (redo)
Custom Enumeration	Yes	Custom Enumeration	Yes
Custom Menu	Partly	Command + Custom Action	No (redo)
Custom Tabs	Yes	Projection Configurations + Aurena Page Designer	No (redo)
Conditional Fields	Yes	Not planned	No
Information Cards	No	Not planned (Not valid for a browser-based application)	No - Deprecated
Custom Events	Yes	Custom Events	Yes
Event Actions	Yes	Event Actions	Yes (URLs need to be updated manually)
Application Configuration Packages	Yes	Application Configuration Packages	Yes
Connector Readers	Yes	Readers	Yes
Connector Senders	Yes	Senders	Yes
Envelops	Yes	Envelops	Yes
Message Queues	Yes	Message Queues	Yes
Routing	Yes	Routing	Yes
Servers	Yes	Servers	Yes (BizAPI related attributes were removed)
Task Templates	No	N/A	No - Deprecated
Transformers	Yes	Transformers	Yes
Routing Addresses	Yes	Routing Addresses	Yes
Routing Rules	Yes	Routing Rules	Yes

Custom Fields

IEE	IFS Cloud Web	IFS Cloud Web other naming suggestion
Custom Fields	Custom Attributes	Attribute Configuration

Concept Mapping:

- Custom Attribute Configuration in IFS Cloud Web includes **Custom Attribute** and **Page Configuration**
- The Attributes with definition and storage are automatically updated. Therefore, Custom Attributes metadata will be automatically fetched from the Logical Unit.
- Assuming the pages in IFS Cloud Web are based on the same data source as in IFS EE, only the Layouts need to be redone in order to make it visible in the IFS Cloud Web Page. If not, relevant changes(Approving Views, redoing attribute definition etc.) need to be done before redoing the Layout.
- Change the Page Layout using Page Designer.

Custom Logical Unit

IEE	IFS Cloud Web	IFS Cloud Web other naming suggestion
Custom Logical Unit	Custom Entity	Entity Configuration

Concept Mapping:

- In Custom Logical Units, metadata will be upgraded in IFS Cloud Web automatically.
- To add a Custom Logical Unit to a standard Page in IFS Cloud Web, this Custom Logical Unit (in the form of an Entity) needs to be added to the Projection which the IFS Cloud Web page is based on.
- After the Projection has been configured, the page layout needs to be configured with the Page Designer

Custom Page

IEE	IFS Cloud Web	IFS Cloud Web other naming suggestion
Custom Page	Custom Page	Page Configuration

Concept Mapping:

- Custom Logical Units metadata will be upgraded in IFS Cloud Web automatically.
- To create a Custom Page in IFS Cloud Web, the Custom Logical Unit/s needs to be added to a new Projection to base the Custom Page on.
- New Custom Page has to be created.
- Layout of the Custom Page need to be redone using Page Designer.

Custom Enumeration

IEE	IFS Cloud Web	IFS Cloud Web other naming suggestion
Custom Enumeration	Custom Enumration	Enumeration Configuration

Concept Mapping:

- Custom Enumeration metadata will be upgraded in IFS Cloud Web automatically.
- The Enumeration with definition and storage are automatically updated. Therefore, Custom Enumeration metadata will be automatically fetched from the Logical Unit used by the Enumeration.
- Assuming the pages in IFS Cloud Web are based on the same data source as in IFS EE, only the Layouts need to be redone in order to make it visible in the IFS Cloud Web Page. If not, relevant changes(Approving Views, redoing attribute definition etc.) need to be done before redoing the Layout.
- Change the Page Layout using Page Designer.

Custom Menu

IEE	IFS Cloud Web	IFS Cloud Web other naming suggestion
Custom Menu	Custom Actions and Commands	

Concept Mapping:

- Currently IFS Cloud Web provides the capability to create Commands to expose PL/SQL methods in IFS Cloud and navigate between pages. If it requires more than what is listed then the user has to customize the Application.
- To execute an existing PL/SQL method defined in the business logic, A Custom Action is created in a Projection.
- To add the Custom Action to a page, this is done by adding it as a Command to the IFS Cloud Web Page.
- To navigate to another page in IFS Cloud, Command has to be created using the Page Designer and it will be added to the Page Layout.

Custom Tabs

IEE	IFS Cloud Web	IFS Cloud Web other naming suggestion
Custom Tabs	Projection Configuration + Page Designer	

Concept Mapping:

Custom Tabs functionality is available in IFS Cloud. In IFS Cloud Web, users can add a Standard Entities to an standard Page by extending an existing Projection. Then that projection can be used to customize existing Standard Pages or Custom Pages The process will be the same as explained in Custom Logical Unit / Custom Entity.

IFS Connect Configurations

- IFS Connect configurations (Connector Readers, Connector Senders, Envelopes, Message Queues, Routing, Servers, Transformers, Routing Addresses, and Routing Rules) were migrated during the upgrade from the IFS Apps10 application to the IFS Cloud application using migration scripts.

- The configuration data (in XML, INS format or other formats) exported from IEE/Apps10 cannot be directly imported into the IFS Cloud application, **similar to other listed configurations**. Additionally, exported table data cannot be imported into the IFS Cloud application database and used as-is, since the database structure has changed.
- These configurations must be migrated through the standard migration process to IFS Cloud.
