

Custom Enumerations

The purpose of Custom Enumerations is to allow you to create new Enumerations that you can use in any Custom Attribute.

An Enumeration can be seen as a data type, so what you do when creating a Custom Enumeration is to create a new data type in IFS Cloud. A Custom Enumeration is a fixed list of values that can be stored in a specific Custom Attribute. Each value has a database representation and client representation. It is also possible to translate each added enumeration client representation.

☐	:	2	Priority 2	20	☒	☐	0
☐	:	3	Priority 3	30	☒	☐	0

Note! Enumerations are suitable when there is a relatively short (think 5-15 values) and fixed/stable list of options to choose from. Enumerations are generally presented as a single or multi-select drop-down list in the user interface.

If you need to have a lot of values then it would be better to create a custom attribute of reference type that refers to a custom entity contain the values. In the user interface references will be presented as list-of-values fields that offer the users full search capabilities (i the list of values) etc.

Add/Edit Custom Enumeration Values

To create a new custom enumeration

1. In the *Custom Enumeration* page, create a new record.

2. Give the enumeration a **name** and a default **prompt**. The name must be in the form "MyEnumeration" with a leading capital letter, and can only contain the characters ' **A-Z** ', ' **a-z** ' and ' **0-9** '.
3. In the table below, add all values for your enumeration. The **DB Value** is what is stored in the database, the **Client Value** is what will be shown to the user. If you want the different values to be presented to the user in a specific order, you can edit the number in the **Seq No** column.
4. Approve the enumeration and at least one of the values.
5. Publish the enumeration.
6. Optionally Translate the enumeration.
