

Distribution of Configured Pages

All IFS Cloud Web page configurations are global, meaning that all end users who has access to the page will see the configuration changes. Completely new IFS Cloud Web pages can be created by duplicating an existing page. These new pages are not linked to any existing navigator items, so the way to access newly created pages are through directly accessing the corresponding web browser URL for the page. Bookmarking that page in IFS Cloud Web is proposed to ease access to the page for the end users.

How to get the URL:

1. Duplicate an existing page
2. Set a name for the new page
3. Refresh and copy the URL from the browser
4. **Example:** The standard page has this URL: `https://<Server>:<Port>/main/ifsapplications/web/page/OperationalReports/OperationalReports` The duplicated page named *MyReports* get the following url: `https://<Server>:<Port>/main/ifsapplications/web/page/OperationalReports/ MyReports`
