

Entity Configurations

Through entity configurations you can create entirely new entities to store arbitrary data in "tables". You can also extend existing entities by adding customer attributes, which can be either persisted values (strings, numbers, dates etc.), references, or calculated values.

The following configuration tasks related to entity configurations can be performed in IFS Cloud. Contents

- [Create Custom Entity](#)
- [Create Custom Attribute](#)
- [Create Custom Enumeration](#)
- [Exclude Entities From Having Custom Attributes](#)
- [Best Practices - Entity Configurations](#)
