

Extending an existing Page Model (Extending a Standard Page)

Standard application pages in IFS Cloud can be extended with Custom Entities. Steps how to add [Custom Entities](#) to standard IFS Cloud pages are described in this section.

Add a Custom Entity to an IFS Cloud Standard Page

The Custom Entity created needs to be added to the **Projection** that the IFS Cloud Web standard page is based on.

- **Step 1** is to find out which projection this is:
- Go to the application page in IFS Cloud Web.
- Open the **User Menu** in the upper right corner.
- Click on Debug: **Enable Debug Console** .
- In **Page Info** tab, the Projection name is provided:

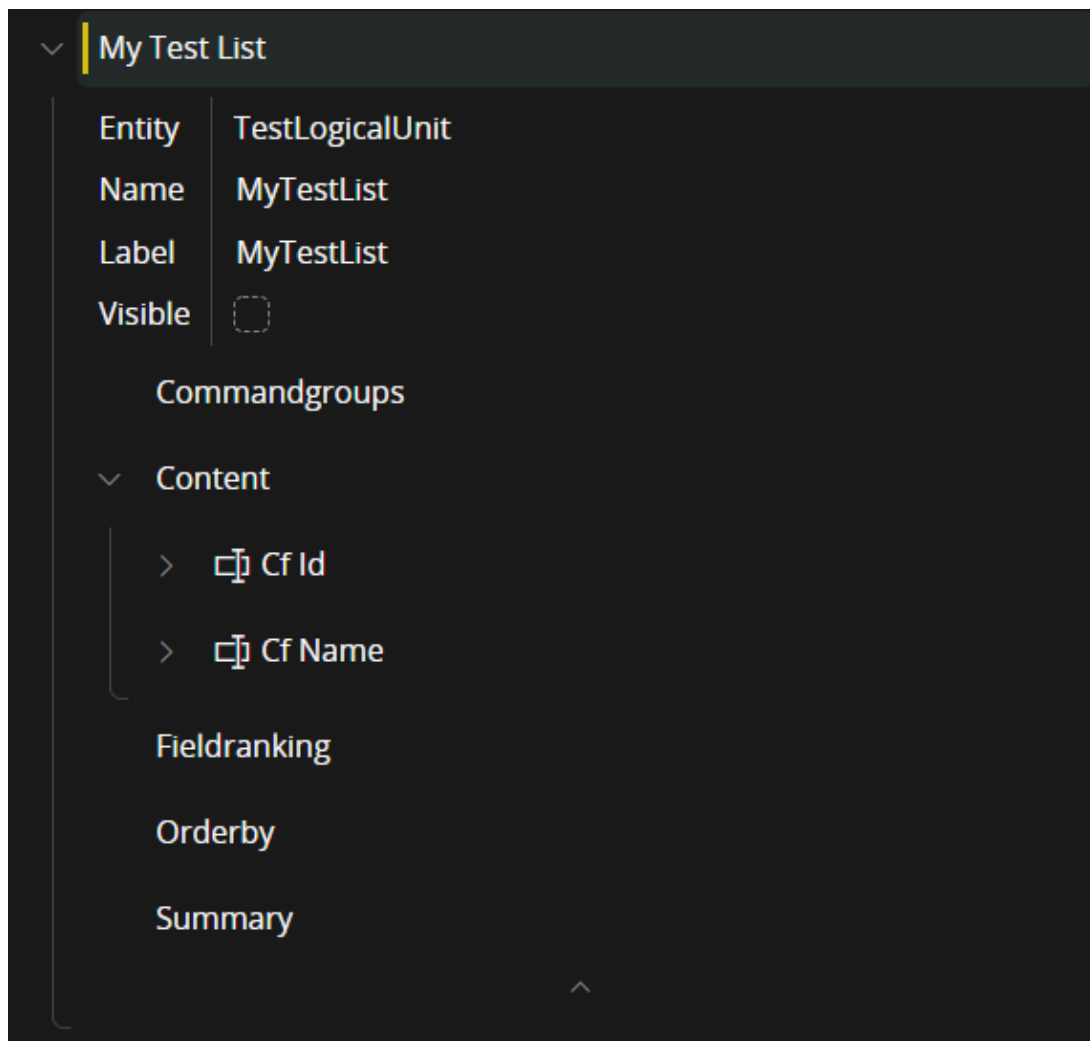

- **Step 2** is to go to **New Projection Configuration** assistant and configure the Projection. (Refer for more Information [Projection Configurations](#))
- **Step 3** is to add the Custom Logical Unit information to the application page:
- Go to the Application Page and open the **Page Designer**.

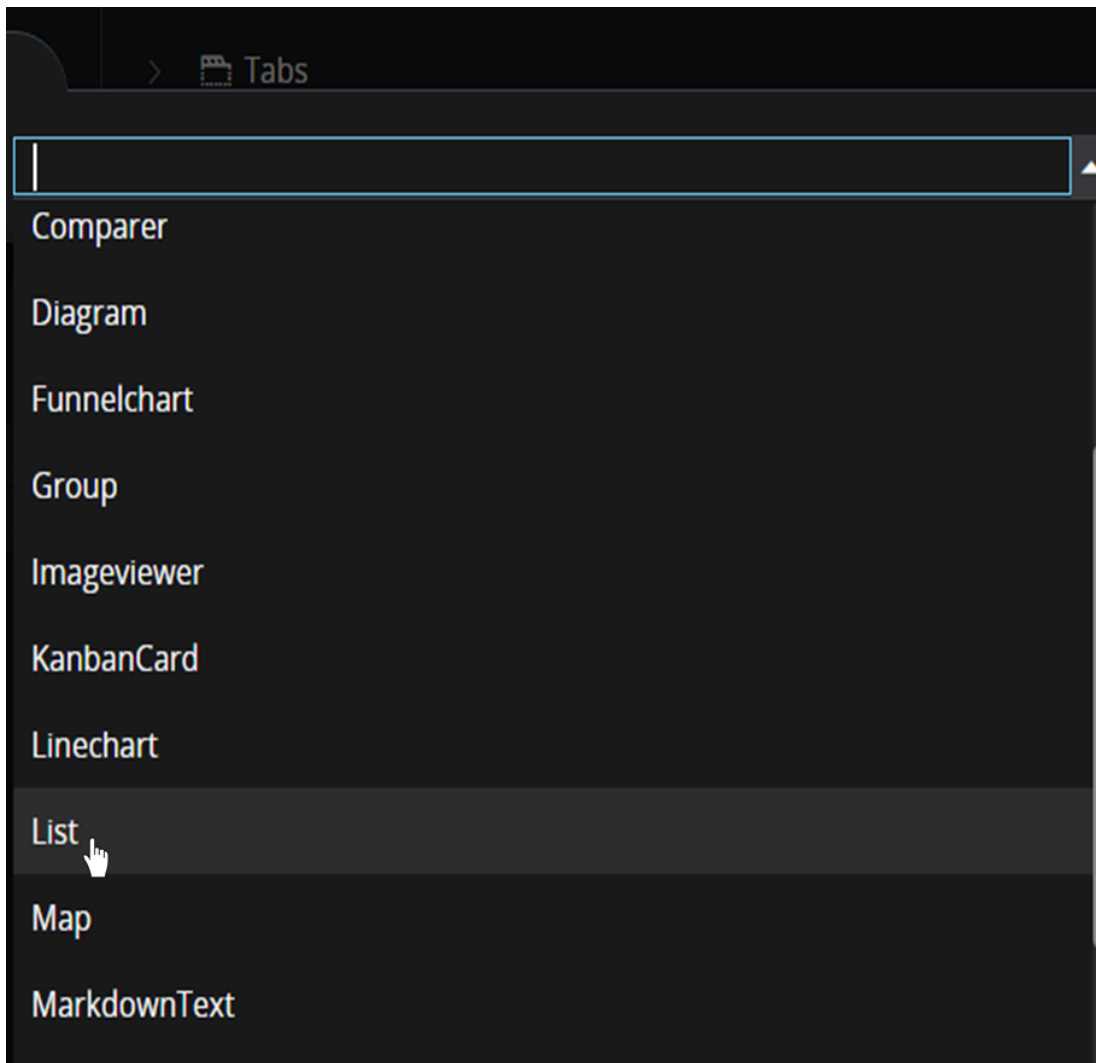

- To create a list with the Custom Logical Unit Attributes: in the **Library Section (ALL ELEMENTS)**, create a **new List**. Set the Custom Logical Unit as the **Entity** and set **Name** and **Label** to the list.

The screenshot shows a configuration window for a 'List'. At the top, there is a tab labeled 'Tabs' with a folder icon. Below the tab, the title 'List' is displayed. The configuration is organized into a table-like structure with three rows: 'Entity' with the value 'TestLogicalUnit', 'Name' with the value 'MyTestList' (which is highlighted with a blue selection box), and 'Label' with the value 'MyTestList'. At the bottom of the configuration area, there are three tabs: 'Cards' (with a card icon), 'Commands' (with a command icon), and a 'List' tab (which is currently active). To the right of the 'Cards' and 'Commands' tabs are checkmark and 'X' icons. The entire interface has a dark theme.

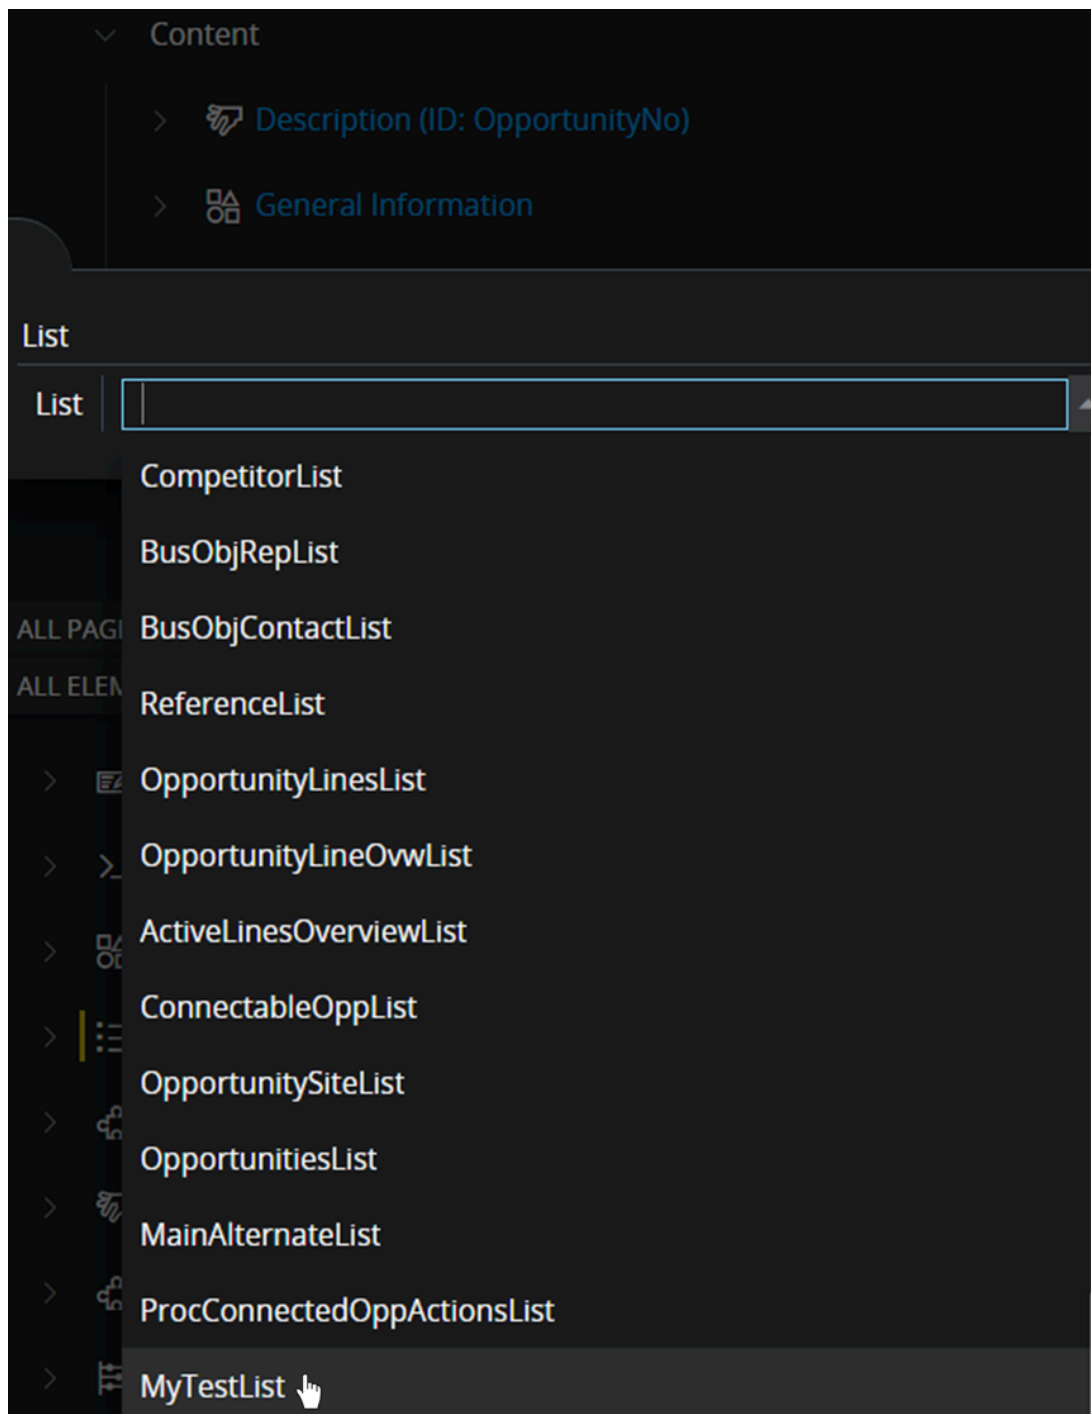

- Stay in the list and add content to it. In this example MyTestList has been added with two Custom Fields.

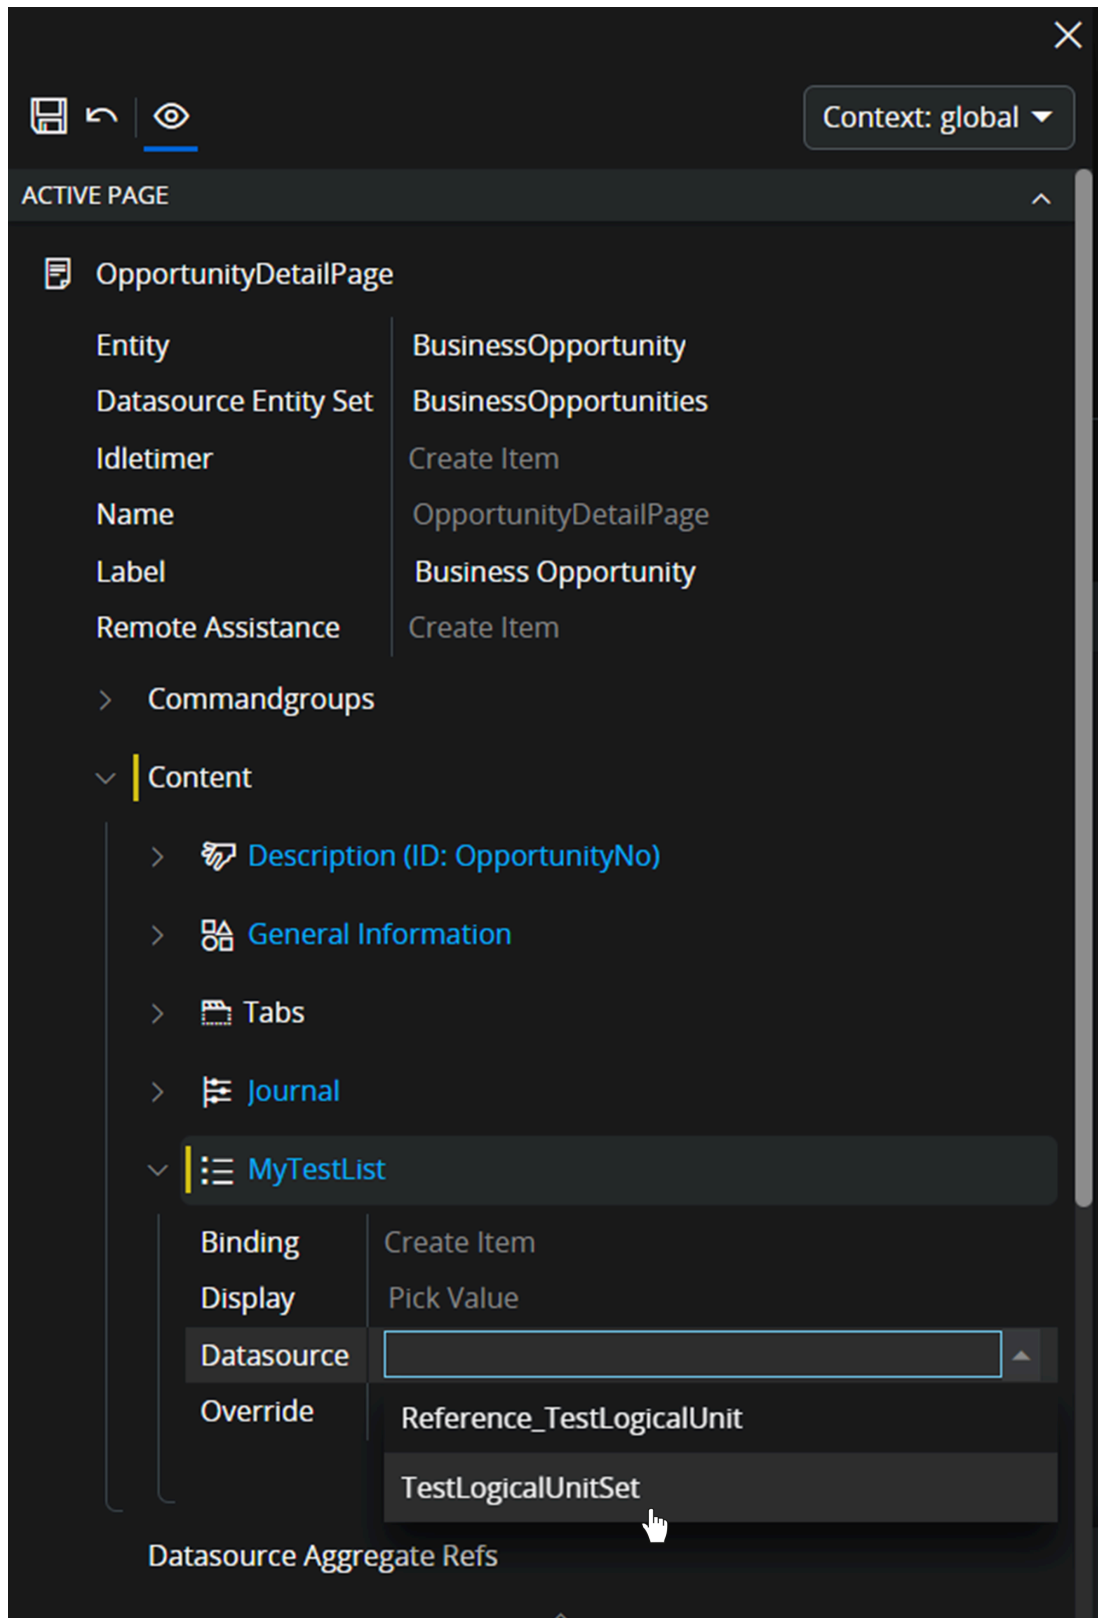

- In the **Active Page** section of the Page Designer, add a new element to the page **Content**. Here it is a List.

- Then select the newly created list from the dropdown menu of available lists.

- Set the **Datasource** to the List.

- **Save** and **Publish** the configuration. The List based on attributes from the Custom Logical Unit is now added to the IFS Cloud Web Standard Page.

- If the records need to be filtered in the list depending on the Master Detail Relationships users can use Associations. (Refer how to configure Associations using Page Designer [Building Master Detail Relationships](#))
